## Release Notes

# PocketBook Basic Lux

FW Version  
Localization

5.17.999  
WW

November 30, 2017

## Firmware 5.17.999 (November 30, 2017)

### Implemented:

#### READING PROGRAM

1. New Reading Program, which contains qualitatively new pages render engine. The new Reading Program opens books more quickly. From now all advanced technologies of books layouts are supported.
2. Option to choose how to work with *PDF* books: the *Quick* or *Universal* method. Users make this choice in the *Open with* context menu, which opens by a long press on the book in the *Library*. The choice users make for each book is saved by the system and then used whenever the book is reopened. The *Quick* method is used by default, and for most books it displays the correct layout. However, for books with more complicated layouts or Adobe DRM-protected books, the *Universal* method should be used instead.
3. In-book dictionary user interface improvements.
4. Addition of the new *Reading with a Dictionary* mode. Now users can read with in-book dictionary access in two ways:
  - a) A *Quick translation* of any word can be made by long pressing of the word in the text. With this method the dictionary works like in previous versions. When the dictionary is not needed any more, the user can close the window by tapping on the corresponding button in the top-right.
  - b) The new *Reading with a Dictionary* mode. This mode can be activated in the Reader settings menu. In this mode, users can quickly open the dictionary by tapping on a word, then hide the dictionary by tapping anywhere else on the screen. Also, when users need to refer to the dictionary more often, they can use the *Freeze* dictionary window function and divide the device's screen into two areas: the reading area and the dictionary. This mode will be permanently active until the user pushes *Exit* in the top-right corner of the dictionary window.
5. It was updated the system of processing *DRM*-protected books. Now all Adobe DRM protected books can be opened without any problems.
6. Password-protected *PDF* books support.
7. Improving the hyphenation system.

## Other improvements

1. Rework of *Settings* app items list, hiding unneeded system files from *Library* app.
2. Tagging loaned books by a certain label in *Library* and *Desktop* applications, ability to return borrowed books by a corresponding item in context menu in *Library* app.
3. Slovenian localization added.

## Fixed:

1. Possible paging buttons events lost while flipping pages in Reader program.
2. Possible incorrect genres folders sorting in *Library* app.
3. Other minor fixes.
