PocketBook

# Release Notes

## PocketBook InkPad 4

| FW VERSION | LOCALIZATION | DATE |
| --- | --- | --- |
| 6.10.2767 | WW | December 24, 2025 |

# FW Version: 6.10.2767 (December 24, 2025)

## Core changes

1. New Pocketbook x Libby App Added – A new app provides access to public libraries, allowing users to read e-books or listen to audiobooks from their local library. Users can search for a library by name, postcode, or city, filter by country, and either preview content or sign in with a library card to borrow books. Borrowed titles can be read offline in the built-in reader or listened to online, with options to place holds, manage loans, and return books early. The app also provides a shelf for quick access to current books, and an intuitive menu to switch libraries or manage library cards.

2. New Feature: Device PIN Code Support.

   Implemented full support for PIN code protection on devices. Users can now secure their devices by setting a 4- or 6-digit PIN code through the system settings. During setup, an email address must be linked to enable PIN recovery; confirmation is required via a link sent to the provided email. The PIN itself is securely stored locally as a hash — it is never transmitted to the server. Users have the ability to change or remove the PIN, as well as to update or unlink the recovery email.

   The system allows flexible control over when the PIN is required: on device startup, unlock, USB connection, or disconnection. If the user forgets the PIN, a recovery flow is available after several failed attempts — this includes sending a signed request to the server and verifying the user through a secure email link. Wi-Fi can be enabled even on a locked device to support this recovery scenario. After a full factory reset, the PIN code is cleared and must be configured again if needed.

3. Introduced a new, enhanced logo customization feature that gives users greater control over the appearance of the device during startup and shutdown. Users can now personalize the Boot and Power-off logos by selecting from several options: use the default system image, show the cover of the currently opened book, or even display the current page as a dynamic screen saver. For a more personalized experience, users may also choose any custom image stored on the device or select up to 10 images to be shown in random order. Additionally, for Power-off mode, there is an option to display no image at all. These new options are available under

Settings > Personalize > Logos and provide a more tailored and visually engaging experience every time the device is used.

4. Added display options for book cover logos (boot and power-off). Users can now choose how the empty space around the book cover is filled — Fill screen, White background (default), Black background, or Depth effect.

5. Accessibility Support Added – The device now includes enhanced accessibility features designed to assist users with visual impairments or reading difficulties, as well as those who wish to personalize their reading comfort. Users can customize the UI text by adjusting Text Size, enabling Bold Text, increasing Grey Text Contrast, and using a Dyslexic Font for improved readability. In addition, Screen Reader mode provides spoken feedback to help users navigate and interact with the device independently and intuitively. These features aim to provide an inclusive and independent reading experience for all users.

6. Added support for logging into multiple Onleihe libraries and switching between them.

7. Added support for LCP-protected PDF files

8. Added support for LCP-protected audio files

9. Updated the system framework to the latest versions to enhance security, reliability, and compatibility with modern technologies.

10. Upgraded the Browser app's web engine to Chrome 122 to deliver a faster, more secure, and smoother web experience, with improved support for modern websites and web technologies.

11. Added Icelandic to the list of available languages in the device user interface.

## Reading program

1. Resolved an issue where some books with a large number of pages (1000 or more) opened slowly or failed to open at all.

2. Resolved an issue where some EPUB books with fixed layout did not utilize the full screen area of the device.

3. Fixed an issue where cover images of some EPUB books did not display fullscreen on the device.

4. Fixed an issue where hyphenation in some Portuguese-language books was incorrectly applied.
5. Fixed an issue where certain EPUB files displayed an excessively high page count due to duplicated chapters
6. Fixed cases where marker-based text selection could behave incorrectly in EPUB2 and EPUB3 files. In some cases, highlighting was not possible or inaccurate, could jump or disappear during interaction, expand incorrectly across multiple lines, or fail to select trailing characters at the end of paragraphs.

## Other improvements

1. Added "+" and "–" buttons in the Advanced Frontlight Settings for more precise frontlight adjustment.
2. Added icons to indicate supported Bluetooth services (e.g., audio devices via A2DP, input devices via HID) in the list of discovered devices, helping users identify which devices can be used with the system.
3. Resolved an issue that could cause some Bluetooth headsets to disconnect during music playback
4. Fixed an issue where audio playback was not correctly routed to previously connected Bluetooth headphones after restarting Bluetooth; sound was sent directly to the device speaker instead.
5. Fixed an intermittent issue with Adobe DRM activation during user registration and authorization in PocketBook Store. In some cases, successful registration or login did not display confirmation messages nor show Adobe DRM account details in Settings > Accounts and Synchronization, and an error message appeared after registration. Now, users consistently receive appropriate success notifications, and Adobe DRM account information is correctly displayed after both registration and authorization processes.
6. Corrected the time zone for Almaty from GMT+6 to GMT+5.
7. Fixed an issue where the G-Sensor icon did not properly indicate activation status and failed to update the device orientation correctly after being toggled.
8. Translations improvements
9. Other minor bugfixes and improvements
